

Computing - Software Development

Form of study: full-time
Engineer's IN MARCH English

Key program features

What will you learn?

Short description

The Software Development major represents an English-language study track within the Informatics program. A software development project involves such steps as e.g. requirements analysis, modeling, implementation, or error rectification. Each of these can be tackled in several ways. Luckily, today's programmers are supported by a large number of dedicated tools that help them develop and manage even the most extended and complicated applications. Importantly, too, software programmers continue to rank among the most demanded professions in the job market. At the same time, a programming language is the most international of all languages, because it is understood and used by people of all nationalities.
